

# Out-Licensing Opportunities

faCellitate GmbH  
[www.facellitate.com](http://www.facellitate.com)

# About Us

faCellitate is a spin off from BASF SE, and it provides innovative and technologically advanced laboratory consumables for application in 3D cell culture and regenerative medicine, among others. Its unique polymeric platform aims at supporting cancer and stem cell research, drug discovery, toxicology and tissue engineering. With faCellitate polymers you can create fully synthetic, biologically relevant environments, and easily add function to your surface. The platform facilitates cell-cell and cell-matrix interactions, significantly improving the biological relevance of cell culture in biomedical research.

The chemically defined, fully synthetic surface coatings bind to plastic and glass surfaces in an extremely easy and fast way. The smart surface obtained can be used to create cellular niches, study molecular interactions, or for simply reducing the background noise. Choose any bio tags to make your surface smart and responsive and save time thanks to a ready-to-use handling.

# faCellitate Core Technology

faCellitate owns unique IP (protected and know-how) for surface coatings consisting of a unique combination of :

- Anchor groups
- Backbone polymers
- Moieties directed towards the solution

## High Flexibility:

Anchor groups can be tailored for binding to many surface types  
Solution-directed moieties can confer a vast range of surface properties

# Licensing Opportunity

## Smart surfaces not only in Life Sciences:

faCellitate has licensing opportunities for surface modifications to meet your needs :

### Surfaces with Ultra-Low Adhesion (ULA) Properties

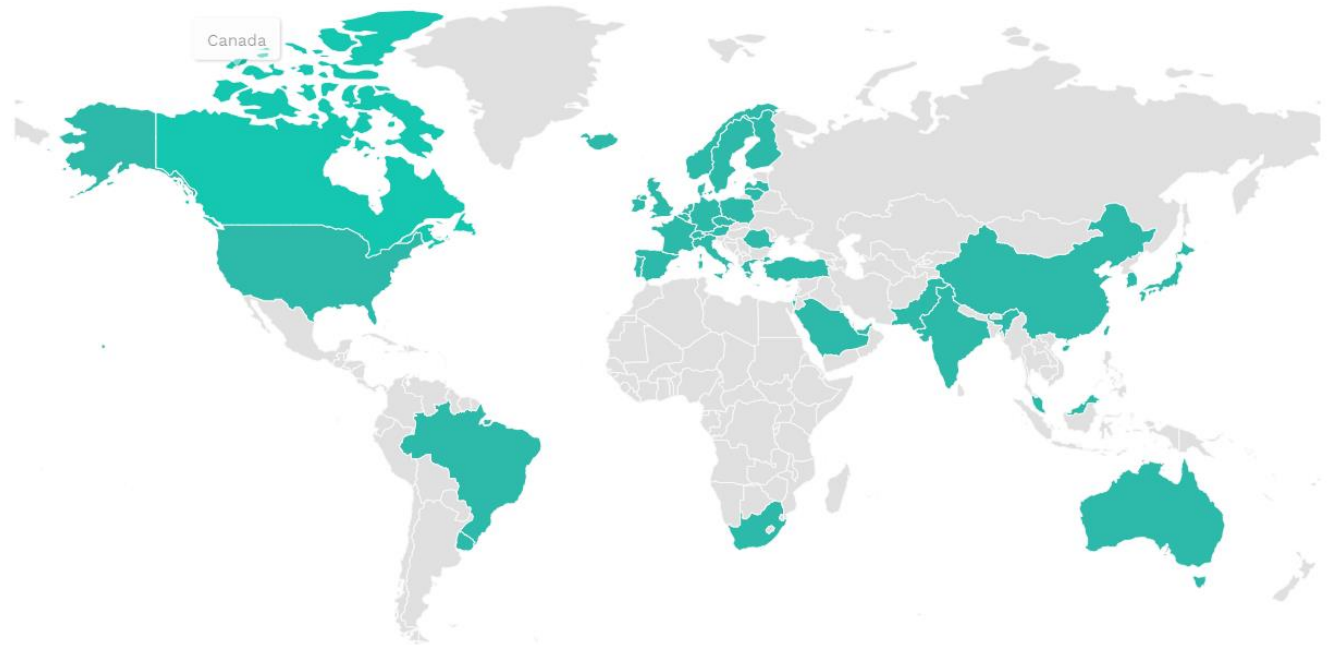

- Zero Absorption of Proteins
- Zero Absorption of Lipids
- Zero Absorptions of Cells

### Ligand Technology to bind

- Cellular receptors
- Proteins – specific binding
- Small molecules
- Amino Acids and Peptides
- Carbohydrates
- Nucleic Acids

Challenge us – we have the solution

# Growing network of Partners & Customers
